Live Video Guard: Intelligent Real-Time Monitoring for Your Home and Business

Your security cameras can do more than record what happened. With **Doyle Security's Live Video Guard**, they can help identify and respond to potential threats in real-time. Combining AI-powered video analytics with professionally trained live monitoring operators, Live Video Guard adds an active layer of protection to your home or business.

AI technology helps identify activities such as people, vehicles, unexpected movement, perimeter activity, driveway arrivals, restricted-area access, and other events that may require attention. When an alert is generated, live trained operators can review the situation in real-time, verify what is happening, and take appropriate action. When needed, operators can use live voice talk-down to deter unwanted activity and coordinate a response with emergency services or designated contacts.

Live Video Guard can provide valuable protection during the hours when properties are most vulnerable, including overnight and after-hours periods. It can be used to monitor areas such as parking lots, building perimeters, HVAC equipment, EV charging stations, restricted areas and residential properties.

Every system is designed around the property it protects. Factors such as the layout, access points, traffic patterns, sensitive areas and privacy requirements help determine how the system is configured.

You can stay connected from wherever you are with verified alerts, live video access, recorded video review, and more.

Your cameras are already watching. Live Video Guard helps make sure someone is watching with them.

Since 1919, Doyle Security has protected homes and businesses with a locally operated, **UL-listed monitoring center** and dedicated local support.
